Climate Science Quick Reader

Climate And Weather

- Weather is what happens over hours or days.
- Climate is the pattern measured over many years.
- Both matter, but they answer different questions.

Evidence

- Scientists use temperature records, ice cores, oceans, satellites, and ecosystems.
- One measurement can be noisy, but many measurements can show a pattern.
- Good science keeps checking the pattern with new data.

Climate Science Quick Reader

Systems

- Air, oceans, land, ice, plants, and people all interact.
- A change in one part of the system can affect another part later.
- This is why climate learning needs patience and careful comparison.

Question Set

- What is one difference between weather and climate?
- Why do scientists use many kinds of evidence?
- What local example helps you think about climate impacts?
